

EDUCATION

RTU MIREA 2nd year

2025 – 2029 · Moscow

Field of study – "Information Systems and Technologies", bachelor's degree (09.03.02). Study program – "Development of Cross-Platform Business Applications".

Additional education

- "Cybersecurity of Data, OS and Applications" – elite training at RTU MIREA (2025 – 2026)
- Online courses from the Sirius Center: "Introduction to ML", "Deep Learning", "NLP", "Data Analysis in Python"

SKILLS

PROGRAMMING LANGUAGES

Python 3.x · C++ 17/20 · HTML5 · CSS3 · Go · SQL · JavaScript

ML / DATA

PyTorch · scikit-learn · pandas · NumPy · SciPy · Matplotlib · Seaborn

INFRASTRUCTURE

Git · Linux · Docker · PostgreSQL · CI/CD · Kubernetes

NETWORKS / API

REST · HTTP / HTTPS · TCP/IP · DNS / SSH · SSL / TLS · gRPC

LANGUAGES

Russian – native

English – B1

confident · basic

Work Experience

Introduction to ML Models

Academic experience

Academic project in data analysis and machine learning in Python

STACK: Python 3.10+ · Pandas · NumPy · Scikit-learn · Matplotlib · Seaborn · Jupyter · Git

Implemented 4 machine learning models – linear and logistic regression, a decision tree, and a random forest – covering regression, binary and multiclass classification. Processed 3 datasets with a total volume of 200,000+ records (Student Performance, Airline Satisfaction, MNIST), built reproducible preprocessing and visualization pipelines. The accuracy of handwritten digit recognition on MNIST with a random forest was over 95%.

AI Insurance Cyber Risk Forecast

Research experience

Forecasting financial losses from cyber incidents

STACK: Python 3.10+ · PyTorch · NumPy · Pandas · SciPy · Scikit-learn · Matplotlib · Seaborn · PyYAML · Pytest · Git

Developed a system for forecasting financial losses from cyber incidents for insurance companies: implemented a full ML pipeline from generating synthetic data (24 features) and preprocessing to training a multi-head neural network with a shared backbone and three heads: incident probability, conditional loss, and unconditional expected loss. Added a console application with a menu, configurations, unit tests, and visualization of underwriting results.

Mission Titan

Research experience

Numerical modeling of an interplanetary flight

STACK: Python 3.10+ · NumPy · SciPy · Matplotlib · Astropy · poliastro · spiceypy · jplephem · Numba

Developed a numerical N-body model of gravitational interaction to calculate the flight trajectory of a spacecraft from the Moon to Titan with a gravity assist at Saturn. Implemented an adaptive 4th-order Runge–Kutta method, a solution to Lambert's problem, and initial velocity correction by the shooting method using high-precision NASA SPICE ephemerides. As a result of the simulation, a decrease in heliocentric velocity of 2.06 km/s and a minimum approach to Titan of 130,034 km were obtained.

> A scientific paper was published: "Numerical Modeling of a Flight to Titan with a Gravity Assist at Saturn" in the proceedings of the IV International Interdepartmental Scientific and Technical Conference (Moscow, 2026).

Achievements

- Finalist of the international algorithmic programming championship "RuCode", 2025.
- Semifinalist of the All-Russian MTS True Tech Champ 2025 championship in the algorithmic programming section.
- Winner (2nd degree diploma) of the hackathon "All-Russian IT Marathon: Digital Tools for Business" 2025, case "Intelligent Sales Manager Assistant".
- 1st degree diploma of the III Annual International Forum of Students and Young Scientists "Security in the Digital Universe", 2026 (developed a numerical integrator for an interplanetary flight trajectory with visualization in Python).
- 2nd degree diploma of the XI Scientific and Technical Conference of Students and Postgraduates of RTU MIREA "Modern Trends in Technological Development", 2026 (developed an AI model in Python for predicting the effectiveness of anti-sanction measures for Russian technology companies).
